Database Maintenance

NetVibe does self-maintenance. The system never requires any maintenance. It is recommended that the database is backed up periodically to a network backup server.

Interfaces on devices not Cisco products

NetVibe supports all Cisco routers, Cisco Switches, and Cisco PIX/ASA firewalls. It does not innately support device health for other products. It does in fact support RFC1213 for interfaces, which is used by many devices.

NetVibe Won't Start

NetVibe fails in startup under the system processes. The process could not start because another product is using Port 80, which is preventing NetVibe from starting.
